

**PEDIATRICS <http://research.peds.wustl.edu/>**

The Department of Pediatrics with approximately 254 full-time, geographically-based faculty provides the majority of the teaching, clinical care and investigation within the area of child health at the University. The Department has 91 fellows in subspecialty training programs and approximately 100 pediatric resident physicians. The Department's faculty members serve on numerous NIH Study Sections and Advisory Panels. At present, 41 members of the Department are members of the Society for Pediatric Research; 87 are members of the American Society for Clinical Investigation; 11 are members of the American Pediatric Society and 4 are members of the Association of American Physicians. Since 1990, 6 Departmental faculty have received the E. Mead Johnson Award for contributions to pediatric research. Research within the Department of Pediatrics is organized into interdisciplinary research "units," two are focused on laboratory science, and the third is the Patient-Oriented Research. Independent of traditional organ-system-based division boundaries, pediatric faculty are organized along themes of common interest and often pursue extensive collaborative work. Laboratories are centered on common core support, such as the genetically-altered mouse core accessible to all investigators. Departmental faculty generated \$45M in extramural support in fiscal year 2019.
